Philip Smith
Multihoming and Communities

- The BGP community attribute is a very powerful tool for assisting and scaling BGP Policies and BGP Multihoming
- Most major Network Operators make extensive use of BGP communities:
  - Internal policies
  - Inter-provider relationships (MED replacement)
  - Customer traffic engineering
Using BGP Communities

- Four scenarios are covered:
  - Use of RFC1998 traffic engineering
  - Extending RFC1998 ideas for even greater customer policy options
  - Community use in Network Operator backbones
  - Customer Policy Control (aka traffic engineering)
RFC1998

An example of how Network Operators use communities...
RFC1998

- Informational RFC
- Describes how to implement loadsharing and backup on multiple inter-AS links
  - BGP communities used to determine local preference in upstream’s network
- Gives control to the customer
  - Means the customer does not have to phone upstream’s technical support to adjust traffic engineering needs
- Simplifies upstream’s configuration
  - Simplifies network operation!
RFC1998

- RFC1998 Community values are defined to have particular meanings

- **ASx:100**
  - set local preference 100
  - Make this the preferred path

- **ASx:90**
  - set local preference 90
  - Make this the backup if dualhomed on ASx

- **ASx:80**
  - set local preference 80
  - The main link is to another provider with same AS path length

- **ASx:70**
  - set local preference 70
  - The main link is to another provider
RFC 1998

- Upstream Provider defines the communities mentioned
- Their customers then attach the communities they want to use to the prefix announcements they are making
- For example:
  - If upstream is AS 100
  - To declare a particular path as a backup path, their customer would announce the prefix with community 100:70 to AS100
  - AS100 would receive the prefix with the community 100:70 tag, and then set local preference to be 70
Sample End-Site Router Configuration

```
router bgp 130
  address-family ipv4
    neighbor 100.66.32.1 remote-as 100
    neighbor 100.66.32.1 description Backup Provider
    neighbor 100.66.32.1 route-map as100-out out
    neighbor 100.66.32.1 send-community
    neighbor 100.66.32.1 activate

! ip as-path access-list 20 permit ^$
!
route-map as100-out permit 10
  match as-path 20
  set community 100:70
!
```
Sample Upstream Router Configuration

```
router bgp 100
  address-family ipv4
  neighbor 100.66.32.2 remote-as 130
  neighbor 100.66.32.2 route-map customer-policy-in in
  neighbor 100.66.32.2 activate
!
! Homed to another Provider
ip community-list 7 permit 100:70
! Homed to another Provider with equal AS_PATH length
ip community-list 8 permit 100:80
! Customer backup routes
ip community-list 9 permit 100:90
!
```
route-map customer-policy-in permit 10
  match community 7
  set local-preference 70
!
route-map customer-policy-in permit 20
  match community 8
  set local-preference 80
!
route-map customer-policy-in permit 30
  match community 9
  set local-preference 90
!
route-map customer-policy-in permit 40
  set local-preference 100
!
RFC1998 was the inspiration for a large variety of differing community policies implemented by Network Operators worldwide.

- There are no “standard communities” for what ISPs do.
- But best practices today consider that Network Operators should use BGP communities extensively for multihoming support of traffic engineering.
- Look in the Network Operator AS Object in the IRR for documented community support.
RFC1998 Example

Two links to the same AS, one link primary, the other link backup
Two links to the same AS

- AS100 proxy aggregates for AS 65534
Two links to the same AS
(one as backup only)

- Announce /19 aggregate on each link
  - primary link makes standard announcement
  - backup link sends community

- When one link fails, the announcement of the /19 aggregate via the other link ensures continued connectivity
Two links to the same AS (one as backup only)

- **Router A Configuration**

```plaintext
router bgp 65534
  address-family ipv4
    network 100.64.0.0 mask 255.255.224.0
  neighbor 100.66.10.2 remote-as 100
  neighbor 100.66.10.2 description RouterC
  neighbor 100.66.10.2 prefix-list aggregate out
  neighbor 100.66.10.2 prefix-list default in
  neighbor 100.66.10.2 activate

! ip prefix-list aggregate permit 100.64.0.0/19
ip prefix-list default permit 0.0.0.0/0
!```
Two links to the same AS (one as backup only)

- Router B Configuration

```conf
router bgp 65534
  address-family ipv4
    network 100.64.0.0 mask 255.255.224.0
    neighbor 100.66.10.6 remote-as 100
    neighbor 100.66.10.6 description RouterD
    neighbor 100.66.10.6 send-community
    neighbor 100.66.10.6 prefix-list aggregate out
    neighbor 100.66.10.6 route-map routerD-out out
    neighbor 100.66.10.6 prefix-list default in
    neighbor 100.66.10.6 route-map routerD-in in
    neighbor 100.66.10.6 activate

!..next slide..
Two links to the same AS
(one as backup only)

```
ip prefix-list aggregate permit 100.64.0.0/19
ip prefix-list default permit 0.0.0.0/0
!
route-map routerD-out permit 10
   match ip address prefix-list aggregate
   set community 100:90
route-map routerD-out permit 20
!
route-map routerD-in permit 10
   set local-preference 90
!```
Two links to the same AS (one as backup only)

- Router C Configuration (main link)

```conf
test router bgp 100
  address-family ipv4
    neighbor 100.66.10.1 remote-as 65534
    neighbor 100.66.10.1 default-originate
    neighbor 100.66.10.1 prefix-list Customer in
    neighbor 100.66.10.1 prefix-list default out
    neighbor 100.66.10.1 activate
  
  ip prefix-list Customer permit 100.64.0.0/19
  ip prefix-list default permit 0.0.0.0/0
```
Two links to the same AS (one as backup only)

- **Router D Configuration (backup link)**

```plaintext
router bgp 100
  address-family ipv4
    neighbor 100.66.10.5 remote-as 65534
    neighbor 100.66.10.5 default-originate
    neighbor 100.66.10.5 prefix-list Customer in
    neighbor 100.66.10.5 route-map bgp-cust-in in
    neighbor 100.66.10.5 prefix-list default out
    neighbor 100.66.10.5 activate

! ip prefix-list Customer permit 100.64.0.0/19
ip prefix-list default permit 0.0.0.0/0
!
...next slide...
```
Two links to the same AS (one as backup only)

! ip community-list 90 permit 100:90
!
<snip>
route-map bgp-cust-in permit 30
  match community 90
  set local-preference 90
route-map bgp-cust-in permit 40
  set local-preference 100
!
Two links to the same AS (one as backup only)

- This is a simple example
- It looks more complicated than the same example presented earlier which used local preference and MEDs
- But the advantage is that this scales better
  - With larger configurations, more customers, more options, it becomes easier to handle each and every requirement
Service Provider use of Communities

RFC1998 was so inspiring...
Background

- RFC1998 is okay for "simple" multihoming situations
- Network Operators create backbone support for many other communities to handle more complex situations
  - Simplify Network Operator BGP configuration
  - Give customer more policy control
Network Operator BGP Communities

- There are no recommended Network Operator BGP communities apart from:
  - RFC1998
  - The well known communities
    - [www.iana.org/assignments/bgp-well-known-communities](http://www.iana.org/assignments/bgp-well-known-communities)
- Efforts have been made to document from time to time:
  - But so far... nothing more... 😞
  - Collection of Network Operator communities at [www.onesc.net/communities](http://www.onesc.net/communities)
  - NANOG Tutorial:
    - [www.nanog.org/meetings/nanog40/presentations/BGPcommunities.pdf](http://www.nanog.org/meetings/nanog40/presentations/BGPcommunities.pdf)
- Network Operator policy is usually published:
  - On the Operator’s website
  - Referenced in the AS Object in the IRR
**Typical Network Operator BGP Communities**

- **X:80**  
  set local preference 80  
  - Backup path
- **X:120**  
  set local preference 120  
  - Primary path (over ride BGP path selection default)
- **X:1**  
  set as-path prepend X  
  - Single prepend when announced to X’s upstreams
- **X:2**  
  set as-path prepend X X  
  - Double prepend when announced to X’s upstreams
- **X:3**  
  set as-path prepend X X X  
  - Triple prepend when announced to X’s upstreams
- **X:666**  
  set ip next-hop 192.0.2.1  
  - Blackhole route – very useful for DoS attack mitigation (RFC7999)
Sample Router Configuration (1)

```
router bgp 100
  address-family ipv4
    neighbor 100.66.32.2 remote-as 130
    neighbor 100.66.32.2 route-map customer-policy-in in
    neighbor 100.66.32.2 activate
    neighbor 100.65.8.9 remote-as 200
    neighbor 100.65.8.9 route-map upstream-out out
    neighbor 100.65.8.9 activate

! ip community-list 1 permit 100:1
ip community-list 2 permit 100:2
ip community-list 3 permit 100:3
ip community-list 4 permit 100:80
ip community-list 5 permit 100:120
ip community-list 6 permit 100:666
! ip route 192.0.2.1 255.255.255.255 null0
```
Sample Router Configuration (2)

route-map customer-policy-in permit 10
  match community 4
  set local-preference 80
!
route-map customer-policy-in permit 20
  match community 5
  set local-preference 120
!
route-map customer-policy-in permit 30
  match community 6
  set ip next-hop 192.0.2.1
!
route-map customer-policy-in permit 40

...etc...
Sample Router Configuration (3)

```
route-map upstream-out permit 10
   match community 1
   set as-path prepend 100
!
route-map upstream-out permit 20
   match community 2
   set as-path prepend 100 100
!
route-map upstream-out permit 30
   match community 3
   set as-path prepend 100 100 100
!
route-map upstream-out permit 40
...
...etc...
```
### WHAT YOU CAN CONTROL

**AS-PATH PREPENDS**

Sprint allows customers to use AS-path prepending to adjust route preference on the network. Such prepending will be received and passed on properly without notifying Sprint of your change in announcements. Additionally, Sprint will prepend AS1239 to eBGP sessions with certain autonomous systems depending on a received community. Currently, the following ASes are supported: 1668, 209, 2914, 3300, 3356, 3549, 3561, 4635, 701, 7018, 702 and 8220.

### BGP customer communities

**Customers wanting to alter local preference on their routes.**

NTT Communications BGP customers may choose to affect our local preference on their routes by marking their routes with the following communities. Our regions are listed [here](http://www.us.ntt.net/support/policy/routing.cfm).

<table>
<thead>
<tr>
<th>Community</th>
<th>Local-pref</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(default)</td>
<td>120</td>
<td>customer</td>
</tr>
<tr>
<td>65520:nnn</td>
<td>50</td>
<td>only within country origin <code>&lt;nnnn&gt;</code> (see country origin list below)</td>
</tr>
<tr>
<td>65530:nnn</td>
<td>50</td>
<td>only within region <code>&lt;nnnn&gt;</code> (see region list below)</td>
</tr>
<tr>
<td>2914:435</td>
<td>50</td>
<td>only beyond the connected country</td>
</tr>
<tr>
<td>2914:436</td>
<td>50</td>
<td>only beyond the connected region</td>
</tr>
<tr>
<td>2914:450</td>
<td>96</td>
<td>customer fallback</td>
</tr>
<tr>
<td>2914:460</td>
<td>98</td>
<td>peer backup</td>
</tr>
<tr>
<td>2914:470</td>
<td>100</td>
<td>peer</td>
</tr>
<tr>
<td>2914:480</td>
<td>110</td>
<td>customer backup</td>
</tr>
<tr>
<td>2914:490</td>
<td>120</td>
<td>customer default</td>
</tr>
<tr>
<td>2914:666</td>
<td></td>
<td>blackhole</td>
</tr>
</tbody>
</table>

**Customers wanting to alter their route announcements to other customers.**

NTT Communications BGP customers may choose to prepend to all other NTT Communications BGP customers with the following communities:

<table>
<thead>
<tr>
<th>Community</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2914:411</td>
<td>prepends s/b to customer 1x</td>
</tr>
<tr>
<td>2914:412</td>
<td>prepends s/b to customer 2x</td>
</tr>
<tr>
<td>2914:413</td>
<td>prepends s/b to customer 3x</td>
</tr>
</tbody>
</table>

**Customers wanting to alter their route announcements to peers.**

NTT Communications BGP customers may choose to prepend to all NTT Communications peers with the following communities:

<table>
<thead>
<tr>
<th>Community</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2914:421</td>
<td>prepends s/b to peer 1x</td>
</tr>
<tr>
<td>2914:422</td>
<td>prepends s/b to peer 2x</td>
</tr>
<tr>
<td>2914:423</td>
<td>prepends s/b to peer 3x</td>
</tr>
<tr>
<td>2914:429</td>
<td>do not advertise to any peer</td>
</tr>
<tr>
<td>2914:439</td>
<td>do not advertise to any peer outside region</td>
</tr>
</tbody>
</table>

*Note: 2914 is the ASN prepend in all cases. If used, 6540x:nnn overrides 655xx:nnn and 2914:429, 655xx:nnn overrides the...*
Example: Verizon Europe

aut-num:        AS702
descr:          Verizon Business EMEA - Commercial IP service provider in Europe

Verizon Business filters out inbound prefixes longer than /24. We also filter any networks within AS702:RS-INBOUND-FILTER.

VzBi uses the following communities with its customers:

702:80   Set Local Pref 80 within AS702
702:120  Set Local Pref 120 within AS702
702:20   Announce only to VzBi AS'es and VzBi customers
702:30   Keep within Europe, don't announce to other VzBi AS's
702:1   Prepend AS702 once at edges of VzBi to Peers
702:2   Prepend AS702 twice at edges of VzBi to Peers
702:3   Prepend AS702 thrice at edges of VzBi to Peers

Advanced communities for customers
702:7020  Do not announce to AS702 peers with a scope of National but advertise to Global Peers, European Peers and VzBi customers.
702:7001  Prepend AS702 once at edges of VzBi to AS702 peers with a scope of National.
702:7002  Prepend AS702 twice at edges of VzBi to AS702 peers with a scope of National.

<snip>
And many more!
Example: Telia

```xml
aut-num:   AS1299
descr:     TeliaSonera International Carrier
<snip>
remarks:   -----------------------------------------
remarks:    BGP COMMUNITY SUPPORT FOR AS1299 TRANSIT CUSTOMERS:
remarks:    Community Action (default local pref 200)
remarks:    European peers
remarks:    Community Action
remarks:    -----------------------
remarks:    1299:50 Set local pref 50 within AS1299 (lowest possible)
remarks:    1299:150 Set local pref 150 within AS1299 (equal to peer, backup)
remarks:    1299:200 All peers Europe incl:
remarks:    1299:250x Sprint/1239
remarks:    1299:251x Savvis/3561

remarks: 169 Cogent AS174
<snip>
```

And many more!
Example: Level3

aut-num: AS3356
descr: Level 3 Communications
<snip>
remarks: customer traffic engineering communities - Suppression
remarks: 64960:XXX - announce to AS XXX if 65000:0
remarks: 65000:0 - announce to customers but not to peers
remarks: 65000:XXX - do not announce at peerings to AS XXX
<snip>
remarks: customer traffic engineering communities - Prepending
remarks: 65001:0 - prepend once to all peers
remarks: 65001:XXX - prepend once at peerings to AS XXX
remarks: 65002:0 - prepend twice to all peers
remarks: 65002:XXX - prepend twice at peerings to AS XXX
<snip>
remarks: customer traffic engineering communities - LocalPref
remarks: 3356:70 - set local preference to 70
remarks: 3356:80 - set local preference to 80
remarks: 3356:90 - set local preference to 90
<snip>
remarks: customer traffic engineering communities - Blackhole
remarks: 3356:9999 - blackhole (discard) traffic
<snip>
And many more!
Creating your own community policy

- Consider creating communities to give policy control to customers
  - Reduces technical support burden
  - Reduces the amount of router reconfiguration, and the chance of mistakes
  - Use previous Network Operator and configuration examples as a guideline
Using Communities for Backbone Scaling

Scaling BGP in the Service Provider backbone...
Communities for iBGP

- Network Operators tag prefixes learned from their BGP and static customers with communities
  - To identify services the customer may have purchased
  - To identify prefixes which are part of the Provider’s PA space
  - To identify PI customer addresses
  - To control prefix distribution in iBGP
  - To control prefix announcements to customers and upstreams
  - (amongst several other reasons)
Service Identification

- Network Operator provides:
  - Transit via upstreams
  - Connectivity via major IXP
  - Connectivity to private peers/customers
- Customers can buy all or any of the above access options
  - Each option is identified with a unique community
- Network Operator identifies whether address space comes from their PA block or is their customers’ own PI space
  - One community for each
## Community Definitions

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>100:1000</td>
<td>AS100 aggregates</td>
</tr>
<tr>
<td>100:1001</td>
<td>AS100 aggregate subprefixes</td>
</tr>
<tr>

</tr>
<tr>
<td>100:2200</td>
<td>Customers who get BGP Customer access</td>
</tr>
<tr>
<td>100:3000</td>
<td>Routes learned from the IXP</td>
</tr>
</tbody>
</table>

```plaintext
ip community-list 10 permit 100:1000
ip community-list 11 permit 100:1001
ip community-list 12 permit 100:1005
ip community-list 13 permit 100:2000
ip community-list 14 permit 100:2100
ip community-list 15 permit 100:2200
ip community-list 16 permit 100:3000
```
Aggregates and Static Customers into BGP

```
router bgp 100
  address-family ipv4
    network 100.64.0.0 mask 255.255.224.0 route-map as100-prefixes
    redistribute static route-map static-to-bgp

! ip prefix-list as100-block permit 100.64.0.0/19 le 32
! route-map as100-prefixes permit 10
  set community 100:1000
!
route-map static-to-bgp permit 10
  match ip address prefix-list as100-block
  set community 100:1001
route-map static-to-bgp permit 20
  set community 100:1005
```

- Aggregate community set
- Aggregate subprefixes community set
- PI community is set
Service Identification

- AS100 has four classes of BGP customers
  - Full transit (upstream, IXP and BGP customers)
  - Upstream only
  - IXP only
  - BGP Customers only

- For BGP support, easiest IOS configuration is to create a peer-group for each class (can also use peer-templates to simplify further)
  - Customer is assigned the peer-group of the service they have purchased
  - Simple for AS100 customer installation engineer to provision
BGP Customers
Creating peer-groups

```
router bgp 100
  address-family ipv4
    neighbor full-transit peer-group
    neighbor full-transit route-map customers-out out
    neighbor full-transit route-map full-transit-in in
    neighbor full-transit default-originate
    neighbor upstream-only peer-group
    neighbor upstream-only route-map customers-out out
    neighbor upstream-only route-map upstream-only-in in
    neighbor upstream-only default-originate
    neighbor ixp-only peer-group
    neighbor ixp-only route-map ixp-routes out
    neighbor ixp-only route-map ixp-only-in in
    neighbor bgpcust-only peer-group
    neighbor bgpcust-only route-map bgp-cust-out out
    neighbor bgpcust-only route-map bgp-cust-in in
```
BGP Customers
Creating route-maps

```
route-map customers-out permit 10
    match ip community 10
!
route-map full-transit-in permit 10
    set community 100:2000 100:2100 100:2200
!
route-map upstream-only-in permit 10
    set community 100:2000
!
route-map ixp-routes permit 10
    match ip community 10 12 13 14 16
!
route-map ixp-only-in permit 10
    set community 100:2100
!
route-map bgp-cust-out permit 10
    match ip community 10 12 13 15
!
route-map bgp-cust-in permit 10
    set community 100:2200
```

Customers only get AS100 aggregates and default route
Full transit go everywhere
Customers buying IXP access only get aggregates, static & full transit customers and IXP routes
Customers buying BGP customer access only get aggregates, static & full transit customers and other BGP customers
BGP Customers – configuring customers

```
router bgp 100
  address-family ipv4
    neighbor 100.67.3.2 remote-as 200
    neighbor 100.67.3.2 peer-group full-transit
    neighbor 100.67.3.2 prefix-list as200cust-in
    neighbor 100.67.3.2 activate
    neighbor 100.67.3.6 remote-as 300
    neighbor 100.67.3.6 peer-group upstream-only
    neighbor 100.67.3.6 prefix-list as300cust-in
    neighbor 100.67.3.6 activate
    neighbor 100.67.3.10 remote-as 400
    neighbor 100.67.3.10 peer-group ixp-only
    neighbor 100.67.3.10 prefix-list as400cust-in
    neighbor 100.67.3.10 activate
    neighbor 100.67.3.14 remote-as 500
    neighbor 100.67.3.14 peer-group bgpcust-only
    neighbor 100.67.3.14 prefix-list as500cust-in
    neighbor 100.67.3.14 activate
```

Customers are placed into the appropriate peer-group depending on the service they paid for.

Note the specific per-customer inbound filters.
BGP Customers – configuring upstream

```conf
category bgp 100
    address-family ipv4
        neighbor 100.66.32.1 remote-as 130
        neighbor 100.66.32.1 prefix-list full-routes in
        neighbor 100.66.32.1 route-map upstream-out out
        neighbor 100.66.32.1 activate

    route-map upstream-out permit 10
        match ip community 10 12 13

    ! IP prefix-list full-routes is the standard bogon
    ! prefix filter - or use a reputable bogon
    ! route-service such as that offered by Team Cymru
```

Aggregates, PI customers and full transit customers are announced to upstream.
BGP Customers – configuring IXP peers

```plaintext
router bgp 100
  address-family ipv4
    neighbor 100.70.0.1 remote-as 901
    neighbor 100.70.0.1 route-map ixp-peers-out out
    neighbor 100.70.0.1 route-map ixp-peers-in in
    neighbor 100.70.0.1 prefix-list AS901-peer in
    neighbor 100.70.0.1 activate
    neighbor 100.70.0.2 remote-as 902
    neighbor 100.70.0.2 route-map ixp-peers-out out
    neighbor 100.70.0.2 route-map ixp-peers-in in
    neighbor 100.70.0.2 prefix-list AS902-peer in
    neighbor 100.70.0.2 activate
!
  route-map ixp-peers-out permit 10
    match ip community 10 12 13 14
!
  route-map ixp-peers-in permit 10
    set community 100:3000
```

Aggregates, PI customers full transit and IXP customers are announced to the IXP
Service Identification

- While the community set up takes a bit of thought and planning, once it is implemented:
  - eBGP configuration with customers is simply a case of applying the appropriate peer-group
  - eBGP configuration with IXP peers is simply a case of announcing the appropriate community members to the peers
  - eBGP configuration with upstreams is simply a case of announcing the appropriate community members to the upstreams
- All BGP policy internally is now controlled by communities
  - No prefix-lists, as-path filters, route-maps or other BGP gymnastics are required
What about iBGP itself?

- We’ve made good use of communities to handle customer requirements
  - But what about iBGP?
- Most Network Operators deploy Route Reflectors as a means of scaling iBGP
- In transit networks:
  - Core routers (the Route Reflectors) carry the full BGP table
  - Edge/Aggregation routers carry domestic prefixes & customers
iBGP core router/route reflector

```
router bgp 100
  address-family ipv4
    neighbor rrc peer-group
    neighbor rrc descr Route Reflector Clients
    neighbor rrc remote-as 100
    neighbor rrc route-reflector-client
    neighbor rrc route-map ibgp-filter out
    neighbor rrc send-community
    neighbor ibgp-peer peer-group
    neighbor ibgp-peer Standard iBGP peers
    neighbor ibgp-peer remote-as 100
    neighbor ibgp-peer send-community
    neighbor 100.64.0.1 peer-group ibgp-peer
    neighbor 100.64.0.1 activate
    neighbor 100.64.0.2 peer-group rrc
    neighbor 100.64.0.2 activate

! route-map ibgp-filter permit 10
  match community 10 11 12 13 14 15 16
!```

- The filter to restrict client iBGP to just domestic prefixes
- Must NOT forget to send community to iBGP peers
- Allow all prefixes coming from the domestic network & IXP
iBGP in the core

- Notice that the filtering of iBGP from the core to the edge is again achieved by a simple route-map applying a community match
  - No prefix-lists, as-path filters or any other complicated policy
  - Once the prefix belongs to a certain community, it has the access across the backbone determined by the community policy in force
Using Communities for Customers Policy

Giving policy control to customers...
Customer Policy Control

- Network Operators have a choice on how to handle policy control for customers
- No delegation of policy options:
  - Customer has no choices
  - If customer wants changes, the operator’s Technical Support handles it
- Limited delegation of policy options:
  - Customer has choices
  - The operator’s Technical Support does not need to be involved
- BGP Communities are the only viable way of offering policy control to customers
Policy Definitions

- Typical definitions:

<table>
<thead>
<tr>
<th>Community</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nil:</td>
<td>No community set, just announce everywhere</td>
</tr>
<tr>
<td>X:1</td>
<td>1x prepend to all BGP neighbours</td>
</tr>
<tr>
<td>X:2</td>
<td>2x prepend to all BGP neighbours</td>
</tr>
<tr>
<td>X:3</td>
<td>3x prepend to all BGP neighbours</td>
</tr>
<tr>
<td>X:80</td>
<td>Local preference set to 80 on customer prefixes</td>
</tr>
<tr>
<td>X:120</td>
<td>Local preference set to 120 on customer prefixes</td>
</tr>
<tr>
<td>X:666</td>
<td>Black hole this route please! (RFC7999)</td>
</tr>
<tr>
<td>X:5000</td>
<td>Don’t announce to any BGP neighbour</td>
</tr>
<tr>
<td>X:5MM0</td>
<td>Don’t announce to BGP neighbour MM</td>
</tr>
<tr>
<td>X:5MMN</td>
<td>Prepend N times to BGP neighbour MM</td>
</tr>
</tbody>
</table>
Policy Implementation

- The BGP configuration for the initial communities was discussed at the start of this slide set.
- But the new communities, X:5MMN, are worth covering in more detail.
  - The operator in AS X documents the BGP transits and peers that they have (MM can be 01 to 99).
  - The operator in AS X indicates how many prepends they will support (N can be 1 to 9, but realistically 4 prepends is usually enough on today’s Internet).
  - Customers then construct communities to do the prepending or announcement blocking they desire.
- If a customer tags a prefix announcement with:
  - 100:5030 don’t send prefix to BGP neighbour 03.
  - 100:5102 2x prepend prefix announcement to peer 10.
Example: Operator in AS 100 has two upstreams. They create policy based on previously slide to allow no announce and up to 3 prepends for their customers

```
ip community-list 100 permit 100:5000
ip community-list 101 permit 100:5001
ip community-list 102 permit 100:5002
ip community-list 103 permit 100:5003
ip community-list 110 permit 100:5010
ip community-list 111 permit 100:5011
ip community-list 112 permit 100:5012
ip community-list 113 permit 100:5013
ip community-list 120 permit 100:5020
ip community-list 121 permit 100:5021
ip community-list 122 permit 100:5022
ip community-list 123 permit 100:5023
```

- Don’t announce anywhere
- Single prepend to all
- Don’t announce to peer 1
- Single prepend to peer 2
Creating route-maps – neighbour 1

route-map bgp-neigh-01 deny 10
  match ip community 100 110
!
route-map bgp-neigh-01 permit 20
  match ip community 101 111
  set as-path prepend 100
!
route-map bgp-neigh-01 permit 30
  match ip community 102 112
  set as-path prepend 100 100
!
route-map bgp-neigh-01 permit 40
  match ip community 103 113
  set as-path prepend 100 100 100
!
route-map bgp-neigh-01 permit 50

Don’t announce these prefixes to neighbour 01
Single prepend of these prefixes to neighbour 01
Double prepend of these prefixes to neighbour 01
Triple prepend of these prefixes to neighbour 01
All other prefixes remain untouched
Creating route-maps – neighbour 2

```
route-map bgp-neigh-02 deny 10
  match ip community 100 120
!
route-map bgp-neigh-02 permit 20
  match ip community 101 121
  set as-path prepend 100
!
route-map bgp-neigh-02 permit 30
  match ip community 102 122
  set as-path prepend 100 100
!
route-map bgp-neigh-02 permit 40
  match ip community 103 123
  set as-path prepend 100 100 100
!
route-map bgp-neigh-02 permit 50
```

Don’t announce these prefixes to neighbour 02

Single prepend of these prefixes to neighbour 02

Double prepend of these prefixes to neighbour 02

Triple prepend of these prefixes to neighbour 02

All other prefixes remain untouched
Operator BGP configuration

```
router bgp 100
  address-family ipv4
    neighbor 100.67.3.2 remote-as 200
    neighbor 100.67.3.2 route-map bgp-neigh-01 out
    neighbor 100.67.3.2 route-map policy-01 in
    neighbor 100.67.3.2 activate
    neighbor 100.67.3.6 remote-as 300
    neighbor 100.67.3.6 route-map bgp-neigh-02 out
    neighbor 100.67.3.6 route-map policy-02 in
    neighbor 100.67.3.6 activate
```

- The route-maps are then applied to the appropriate neighbour
- As long as the customer sets the appropriate communities, the policy will be applied to their prefixes
Customer BGP configuration

```
router bgp 600
  address-family ipv4
    neighbor 100.69.1.1 remote-as 100
    neighbor 100.69.1.1 route-map upstream out
    neighbor 100.69.1.1 prefix-list default in
    neighbor 100.69.1.1 activate
!
route-map upstream permit 10
  match ip address prefix-list blockA
  set community 100:5010 100:5023
route-map upstream permit 20
  match ip address prefix-list aggregate
```

- This will:
  - 3x prepend of blockA towards their upstream’s 2nd BGP neighbour
  - Not announce blockA towards their upstream’s 1st BGP neighbour
  - Let the aggregate through with no specific policy
Customer Policy Control

- Notice how much flexibility a BGP customer could have with this type of policy implementation

- Advantages:
  - Customer has flexibility
  - Operator Technical Support does not need to be involved

- Disadvantages
  - Customer could upset the operator’s loadbalancing tuning

- Advice
  - This kind of policy control is very useful, but should only be considered if appropriate for the circumstances
Conclusion
Communities

- Communities are fun! 😊
- And they are extremely powerful tools
- Think about community policies, e.g. like the additions described here
- Supporting extensive community usage makes customer configuration easy
- Watch out for routing loops!
Using BGP Communities
