Multihoming and Communities

- The BGP community attribute is a very powerful tool for assisting and scaling BGP Policies and BGP Multihoming
- Most major Network Operators make extensive use of BGP communities:
 - Internal policies
 - Inter-provider relationships (MED replacement)
 - Customer traffic engineering

Using BGP Communities

- □ Four scenarios are covered:
 - Use of RFC1998 traffic engineering
 - Extending RFC1998 ideas for even greater customer policy options
 - Community use in Network Operator backbones
 - Customer Policy Control (aka traffic engineering)

An example of how Network Operators use communities...

- Informational RFC
- Describes how to implement loadsharing and backup on multiple inter-AS links
 - BGP communities used to determine local preference in upstream's network
- Gives control to the customer
 - Means the customer does not have to phone upstream's technical support to adjust traffic engineering needs
- Simplifies upstream's configuration
 - Simplifies network operation!

- RFC1998 Community values are defined to have particular meanings
- □ ASX:100 set local preference 100
 - Make this the preferred path
- □ ASX:90 set local preference 90
 - Make this the backup if dualhomed on ASx
- □ ASX:80 set local preference 80
 - The main link is to another provider with same AS path length
- □ ASX:70 set local preference 70
 - The main link is to another provider

- Upstream Provider defines the communities mentioned
- Their customers then attach the communities they want to use to the prefix announcements they are making
- For example:
 - If upstream is AS 100
 - To declare a particular path as a backup path, their customer would announce the prefix with community 100:70 to AS100
 - AS100 would receive the prefix with the community 100:70 tag, and then set local preference to be 70

■ Sample End-Site Router Configuration

```
router bgp 130
address-family ipv4
neighbor 100.66.32.1 remote-as 100
neighbor 100.66.32.1 description Backup Provider
neighbor 100.66.32.1 route-map as100-out out
neighbor 100.66.32.1 send-community
neighbor 100.66.32.1 activate
!
ip as-path access-list 20 permit ^$
!
route-map as100-out permit 10
match as-path 20
set community 100:70
!
```

Sample Upstream Router Configuration

```
router bgp 100
address-family ipv4
neighbor 100.66.32.2 remote-as 130
neighbor 100.66.32.2 route-map customer-policy-in in neighbor 100.66.32.2 activate
!
! Homed to another Provider
ip community-list 7 permit 100:70
! Homed to another Provider with equal ASPATH length
ip community-list 8 permit 100:80
! Customer backup routes
ip community-list 9 permit 100:90
!
```

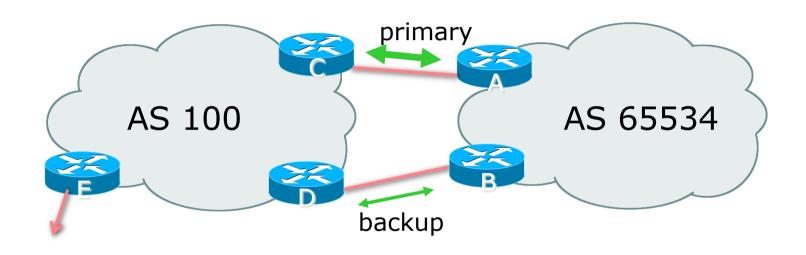

```
route-map customer-policy-in permit 10
match community 7
set local-preference 70
!
route-map customer-policy-in permit 20
match community 8
set local-preference 80
!
route-map customer-policy-in permit 30
match community 9
set local-preference 90
!
route-map customer-policy-in permit 40
set local-preference 100
!
```

- RFC1998 was the inspiration for a large variety of differing community policies implemented by Network Operators worldwide
- □ There are no "standard communities" for what ISPs do
- But best practices today consider that Network Operators should use BGP communities extensively for multihoming support of traffic engineering
- Look in the Network Operator AS Object in the IRR for documented community support

RFC1998 Example

Two links to the same AS, one link primary, the other link backup

Two links to the same AS

□ AS100 proxy aggregates for AS 65534

- Announce /19 aggregate on each link
 - primary link makes standard announcement
 - backup link sends community
- When one link fails, the announcement of the /19 aggregate via the other link ensures continued connectivity

Router A Configuration

```
router bgp 65534
address-family ipv4
network 100.64.0.0 mask 255.255.224.0
neighbor 100.66.10.2 remote-as 100
neighbor 100.66.10.2 description RouterC
neighbor 100.66.10.2 prefix-list aggregate out
neighbor 100.66.10.2 prefix-list default in
neighbor 100.66.10.2 activate
!
ip prefix-list aggregate permit 100.64.0.0/19
ip prefix-list default permit 0.0.0.0/0
!
```

Router B Configuration

```
router bgp 65534
address-family ipv4
network 100.64.0.0 mask 255.255.224.0
neighbor 100.66.10.6 remote-as 100
neighbor 100.66.10.6 description RouterD
neighbor 100.66.10.6 send-community
neighbor 100.66.10.6 prefix-list aggregate out
neighbor 100.66.10.6 route-map routerD-out out
neighbor 100.66.10.6 prefix-list default in
neighbor 100.66.10.6 route-map routerD-in in
neighbor 100.66.10.6 activate
!
..next slide..
```

```
ip prefix-list aggregate permit 100.64.0.0/19
ip prefix-list default permit 0.0.0.0/0
!
route-map routerD-out permit 10
  match ip address prefix-list aggregate
  set community 100:90
route-map routerD-out permit 20
!
route-map routerD-in permit 10
  set local-preference 90
!
```

Router C Configuration (main link)

```
router bgp 100
address-family ipv4
neighbor 100.66.10.1 remote-as 65534
neighbor 100.66.10.1 default-originate
neighbor 100.66.10.1 prefix-list Customer in
neighbor 100.66.10.1 prefix-list default out
neighbor 100.66.10.1 activate
!
ip prefix-list Customer permit 100.64.0.0/19
ip prefix-list default permit 0.0.0.0/0
```

Router D Configuration (backup link)

```
router bgp 100
address-family ipv4
neighbor 100.66.10.5 remote-as 65534
neighbor 100.66.10.5 default-originate
neighbor 100.66.10.5 prefix-list Customer in
neighbor 100.66.10.5 route-map bgp-cust-in in
neighbor 100.66.10.5 prefix-list default out
neighbor 100.66.10.5 activate
!
ip prefix-list Customer permit 100.64.0.0/19
ip prefix-list default permit 0.0.0.0/0
!
...next slide...
```

```
!
ip community-list 90 permit 100:90
!
<snip>
route-map bgp-cust-in permit 30
  match community 90
  set local-preference 90
route-map bgp-cust-in permit 40
  set local-preference 100
!
```

- □ This is a simple example
- It looks more complicated than the same example presented earlier which used local preference and MEDs
- But the advantage is that this scales better
 - With larger configurations, more customers, more options, it becomes easier to handle each and every requirement

Service Provider use of Communities

RFC1998 was so inspiring...

Background

- RFC1998 is okay for "simple" multihoming situations
- Network Operators create backbone support for many other communities to handle more complex situations
 - Simplify Network Operator BGP configuration
 - Give customer more policy control

Network Operator BGP Communities

- There are no recommended Network Operator BGP communities apart from
 - RFC1998
 - The well known communities
 - www.iana.org/assignments/bgp-well-known-communities
- Efforts have been made to document from time to time
 - totem.info.ucl.ac.be/publications/papers-elec-versions/draft-quoitin-bgp-commsurvey-00.pdf
 - But so far... nothing more... ⊗
 - Collection of Network Operator communities at www.onesc.net/communities
 - NANOG Tutorial: www.nanog.org/meetings/nanog40/presentations/BGPcommunities.pdf
- Network Operator policy is usually published
 - On the Operator's website
 - Referenced in the AS Object in the IRR

Typical Network Operator BGP Communities

□ X:80 set local preference 80 Backup path □ X:120 set local preference 120 Primary path (over ride BGP path selection default) □ X:1 set as-path prepend X Single prepend when announced to X's upstreams □ X:2 set as-path prepend X X Double prepend when announced to X's upstreams □ X:3 set as-path prepend X X X Triple prepend when announced to X's upstreams □ X:666 set ip next-hop 192.0.2.1 Blackhole route – very useful for DoS attack mitigation (RFC7999)

Sample Router Configuration (1)

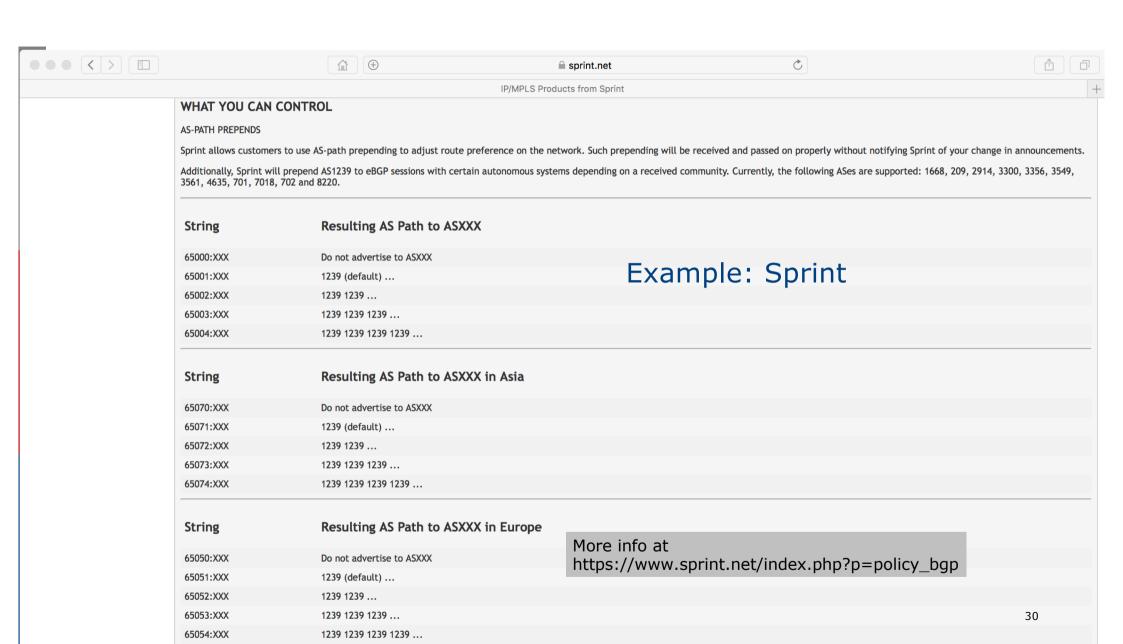

```
router bgp 100
 address-family ipv4
                                           Customer BGP
 neighbor 100.66.32.2 remote-as 130
 neighbor 100.66.32.2 route-map customer-policy-in in
 neighbor 100.66.32.2 activate
 neighbor 100.65.8.9 remote-as 200
 neighbor 100.65.8.9 route-map upstream-out out
 neighbor 100.65.8.9 activate
                                           Upstream BGP
ip community-list 1 permit 100:1
ip community-list 2 permit 100:2
ip community-list 3 permit 100:3
ip community-list 4 permit 100:80
                                          Black hole route
ip community-list 5 permit 100:120
                                          (on all routers)
ip community-list 6 permit 100:666
ip route 192.0.2.1 255.255.255.255 null0
```

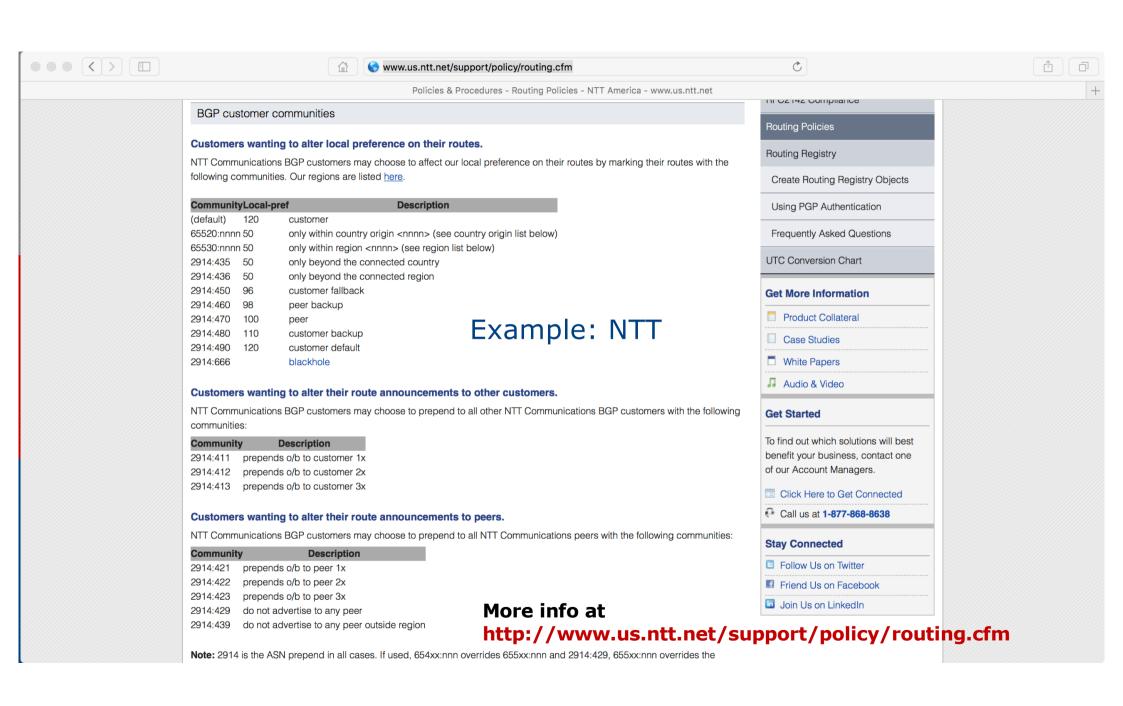

Sample Router Configuration (2)

```
route-map customer-policy-in permit 10
match community 4
set local-preference 80
!
route-map customer-policy-in permit 20
match community 5
set local-preference 120
!
route-map customer-policy-in permit 30
match community 6
set ip next-hop 192.0.2.1
!
route-map customer-policy-in permit 40
...etc...
```

Sample Router Configuration (3)

```
route-map upstream-out permit 10
match community 1
set as-path prepend 100
!
route-map upstream-out permit 20
match community 2
set as-path prepend 100 100
!
route-map upstream-out permit 30
match community 3
set as-path prepend 100 100 100
!
route-map upstream-out permit 40
...etc...
```

Example: Verizon Europe

aut-num: AS702 Verizon Business EMEA - Commercial IP service provider in Europe descr: <snip> remarks: Verizon Business filters out inbound prefixes longer than /24. We also filter any networks within AS702:RS-INBOUND-FILTER. VzBi uses the following communities with its customers: 702:80 Set Local Pref 80 within AS702 702:120 Set Local Pref 120 within AS702 702:20 Announce only to VzBi AS'es and VzBi customers 702:30 Keep within Europe, don't announce to other VzBi AS's Prepend AS702 once at edges of VzBi to Peers 702:1 702:2 Prepend AS702 twice at edges of VzBi to Peers 702:3 Prepend AS702 thrice at edges of VzBi to Peers Advanced communities for customers 702:7020 Do not announce to AS702 peers with a scope of National but advertise to Global Peers, European Peers and VzBi customers. 702:7001 Prepend AS702 once at edges of VzBi to AS702 peers with a scope of National. 702:7002 Prepend AS702 twice at edges of VzBi to AS702 peers with a scope of National. And many more! <snip>

Example: Telia

```
aut-num:
                AS1299
descr:
                TeliaSonera International Carrier

Creating your own community policy

- Consider creating communities to give policy control to customers
 - Reduces technical support burden
 - Reduces the amount of router reconfiguration, and the chance of mistakes
 - Use previous Network Operator and configuration examples as a guideline

Using Communities for Backbone Scaling

Scaling BGP in the Service Provider backbone...

Communities for iBGP

- Network Operators tag prefixes learned from their BGP and static customers with communities
 - To identify services the customer may have purchased
 - To identify prefixes which are part of the Provider's PA space
 - To identify PI customer addresses
 - To control prefix distribution in iBGP
 - To control prefix announcements to customers and upstreams
 - (amongst several other reasons)

Service Identification

- Network Operator provides:
 - Transit via upstreams
 - Connectivity via major IXP
 - Connectivity to private peers/customers
- Customers can buy all or any of the above access options
 - Each option is identified with a unique community
- Network Operator identifies whether address space comes from their PA block or is their customers' own PI space
 - One community for each

Community Definitions

```
100:1000 AS100 aggregates
100:1001 AS100 aggregate subprefixes
100:1005 Static Customer PI space
100:2000 Customers who get Transit
100:2100 Customers who get IXP access
100:2200 Customers who get BGP Customer access
100:3000 Routes learned from the IXP
```

```
ip community-list 10 permit 100:1000
ip community-list 11 permit 100:1001
ip community-list 12 permit 100:1005
ip community-list 13 permit 100:2000
ip community-list 14 permit 100:2100
ip community-list 15 permit 100:2200
ip community-list 16 permit 100:3000
```

Aggregates and Static Customers into BGP

```
router bgp 100
address-family ipv4
 network 100.64.0.0 mask 255.255.224.0 route-map as100-prefixes
 redistribute static route-map static-to-bqp
ip prefix-list as100-block permit 100.64.0.0/19 le 32
route-map as100-prefixes permit 10
                                               Aggregate community set
set community 100:1000
route-map static-to-bgp permit 10
match ip address prefix-list as100-block
                                               Aggregate subprefixes
 set community 100:1001
                                               community set
route-map static-to-bgp permit 20
 set community 100:1005
                                               PI community is set
```

Service Identification

- AS100 has four classes of BGP customers
 - Full transit (upstream, IXP and BGP customers)
 - Upstream only
 - IXP only
 - BGP Customers only
- For BGP support, easiest IOS configuration is to create a peergroup for each class (can also use peer-templates to simplify further)
 - Customer is assigned the peer-group of the service they have purchased
 - Simple for AS100 customer installation engineer to provision

BGP Customers Creating peer-groups

```
router bgp 100
 address-family ipv4
  neighbor full-transit peer-group
  neighbor full-transit route-map customers-out out
  neighbor full-transit route-map full-transit-in in
  neighbor full-transit default-originate
  neighbor upstream-only peer-group
  neighbor upstream-only route-map customers-out out
  neighbor upstream-only route-map upstream-only-in in
 neighbor upstream-only default-originate
  neighbor ixp-only peer-group
  neighbor ixp-only route-map ixp-routes out
  neighbor ixp-only route-map ixp-only-in in
  neighbor bgpcust-only peer-group
  neighbor bgpcust-only route-map bgp-cust-out out
  neighbor bgpcust-only route-map bgp-cust-in in
```

BGP Customers Creating route-maps

```
route-map customers-out permit 10
                                        Customers only get AS100
match ip community 10
                                        aggregates and default route
route-map full-transit-in permit 10
 set community 100:2000 100:2100 100:2200
                                           Full transit go everywhere
route-map upstream-only-in permit 10
 set community 100:2000
route-map ixp-routes permit 10
match ip community 10 12 13 14 16
                                         Customers buying IXP
                                         access only get aggregates,
route-map ixp-only-in permit 10
                                         static & full transit
 set community 100:2100
                                         customers and IXP routes
route-map bgp-cust-out permit 10
match ip community 10 12 13 15
                                     Customers buying BGP customer
                                     access only get aggregates,
route-map bgp-cust-in permit 10
                                     static & full transit customers
 set community 100:2200
                                     and other BGP customers
```

BGP Customers – configuring customers

```
router bgp 100
address-family ipv4
 neighbor 100.67.3.2 remote-as 200
 neighbor 100.67.3.2 peer-group full-transit
 neighbor 100.67.3.2 prefix-list as200cust-in
 neighbor 100.67.3.2 activate
 neighbor 100.67.3.6 remote-as 300
 neighbor 100.67.3.6 peer-group upstream-only
 neighbor 100.67.3.6 prefix-list as300cust-in
 neighbor 100.67.3.6 activate
 neighbor 100.67.3.10 remote-as 400
 neighbor 100.67.3.10 peer-group ixp-only
 neighbor 100.67.3.10 prefix-list as400cust-in
 neighbor 100.67.3.10 activate
 neighbor 100.67.3.14 remote-as 500
 neighbor 100.67.3.14 peer-group bgpcust-only
 neighbor 100.67.3.14 prefix-list as500cust-in
 neighbor 100.67.3.14 activate
```

Customers are placed into the appropriate peer-group depending on the service they paid for

Note the specific per-customer inbound filters

BGP Customers – configuring upstream

```
router bgp 100
address-family ipv4
neighbor 100.66.32.1 remote-as 130
neighbor 100.66.32.1 prefix-list full-routes in
neighbor 100.66.32.1 route-map upstream-out out
neighbor 100.66.32.1 activate
!
route-map upstream-out permit 10
match ip community 10 12 13
!
! IP prefix-list full-routes is the standard bogon
! prefix filter - or use a reputable bogon
! route-service such as that offered by Team Cymru
```

Aggregates, PI customers and full transit customers are announced to upstream

BGP Customers – configuring IXP peers

```
router bgp 100
address-family ipv4
 neighbor 100.70.0.1 remote-as 901
 neighbor 100.70.0.1 route-map ixp-peers-out out
 neighbor 100.70.0.1 route-map ixp-peers-in in
 neighbor 100.70.0.1 prefix-list AS901-peer in
 neighbor 100.70.0.1 activate
 neighbor 100.70.0.2 remote-as 902
 neighbor 100.70.0.2 route-map ixp-peers-out out
 neighbor 100.70.0.2 route-map ixp-peers-in in
 neighbor 100.70.0.2 prefix-list AS902-peer in
 neighbor 100.70.0.2 activate
                                                 Aggregates, PI
                                                 customers full transit
route-map ixp-peers-out permit 10
                                                 and IXP customers are
match ip community 10 12 13 14
                                                 announced to the IXP
route-map ixp-peers-in permit 10
set community 100:3000
```

Service Identification

- While the community set up takes a bit of thought and planning, once it is implemented:
 - eBGP configuration with customers is simply a case of applying the appropriate peer-group
 - eBGP configuration with IXP peers is simply a case of announcing the appropriate community members to the peers
 - eBGP configuration with upstreams is simply a case of announcing the appropriate community members to the upstreams
- All BGP policy internally is now controlled by communities
 - No prefix-lists, as-path filters, route-maps or other BGP gymnastics are required

What about iBGP itself?

- We've made good use of communities to handle customer requirements
 - But what about iBGP?
- Most Network Operators deploy Route Reflectors as a means of scaling iBGP
- In transit networks:
 - Core routers (the Route Reflectors) carry the full BGP table
 - Edge/Aggregation routers carry domestic prefixes & customers

iBGP core router/route reflector

```
router bop 100
 address-family ipv4
                                               The filter to restrict
  neighbor rrc peer-group
                                               client iBGP to just
  neighbor rrc descr Route Reflector Clients
                                               domestic prefixes
  neighbor rrc remote-as 100
  neighbor rrc route-reflector-client
  neighbor rrc route-map ibgp-filter out
  neighbor rrc send-community <
                                                   Must NOT
  neighbor ibgp-peer peer-group
                                                   forget to send
  neighbor ibgp-peer Standard iBGP peers
                                                   community to
  neighbor ibgp-peer remote-as 100
                                                   iBGP peers
  neighbor ibqp-peer send-community
  neighbor 100.64.0.1 peer-group ibgp-peer
  neighbor 100.64.0.1 activate
                                                 Allow all prefixes
  neighbor 100.64.0.2 peer-group rrc
                                                 coming from the
  neighbor 100.64.0.2 activate
                                                 domestic network
                                                 & IXP
route-map ibgp-filter permit 10
match community 10 11 12 13 14 15 16
```

iBGP in the core

- Notice that the filtering of iBGP from the core to the edge is again achieved by a simple route-map applying a community match
 - No prefix-lists, as-path filters or any other complicated policy
 - Once the prefix belongs to a certain community, it has the access across the backbone determined by the community policy in force

Using Communities for Customers Policy

Giving policy control to customers...

Customer Policy Control

- Network Operators have a choice on how to handle policy control for customers
- No delegation of policy options:
 - Customer has no choices
 - If customer wants changes, the operator's Technical Support handles it
- Limited delegation of policy options:
 - Customer has choices
 - The operator's Technical Support does not need to be involved
- BGP Communities are the only viable way of offering policy control to customers

Policy Definitions

■ Typical definitions:

Community	Action
Nil:	No community set, just announce everywhere
X:1	1x prepend to all BGP neighbours
X:2	2x prepend to all BGP neighbours
X:3	3x prepend to all BGP neighbours
X:80	Local preference set to 80 on customer prefixes
X:120	Local preference set to 120 on customer prefixes
X:666	Black hole this route please! (RFC7999)
X:5000	Don't announce to any BGP neighbour
X:5MM0	Don't announce to BGP neighbour MM
X:5MMN	Prepend N times to BGP neighbour MM

Policy Implementation

- The BGP configuration for the initial communities was discussed at the start of this slide set
- But the new communities, X:5MMN, are worth covering in more detail
 - The operator in AS X documents the BGP transits and peers that they have (MM can be 01 to 99)
 - The operator in AS X indicates how many prepends they will support (N can be 1 to 9, but realistically 4 prepends is usually enough on today's Internet)
 - Customers then construct communities to do the prepending or announcement blocking they desire
- If a customer tags a prefix announcement with:
 - 100:5030 don't send prefix to BGP neighbour 03
 - 100:5102 2x prepend prefix announcement to peer 10

Community Definitions

Example: Operator in AS 100 has two upstreams. They create policy based on previously slide to allow no announce and up to 3 prepends for their customers

```
Don't announce anywhere
ip community-list 100 permit 100:5000
ip community-list 101 permit 100:5001
                                           Single prepend to all
ip community-list 102 permit 100:5002
ip community-list 103 permit 100:5003
ip community-list 110 permit 100:5010
                                          Don't announce to peer 1
ip community-list 111 permit 100:5011
ip community-list 112 permit 100:5012
ip community-list 113 permit 100:5013
ip community-list 120 permit 100:5020
ip community-list 121 permit 100:5021
                                          Single prepend to peer 2
ip community-list 122 permit 100:5022
ip community-list 123 permit 100:5023
```

Creating route-maps – neighbour 1

```
Don't announce these
route-map bgp-neigh-01 deny 10
                                           prefixes to neighbour 01
match ip community 100 110
route-map bgp-neigh-01 permit 20
match ip community 101 111
                                           Single prepend of these
 set as-path prepend 100
                                           prefixes to neighbour 01
route-map bgp-neigh-01 permit 30
match ip community 102 112
 set as-path prepend 100 100
                                           Double prepend of these
                                           prefixes to neighbour 01
route-map bgp-neigh-01 permit 40
match ip community 103 113
 set as-path prepend 100 100 100
                                           Triple prepend of these
route-map bgp-neigh-01 permit 50
                                           prefixes to neighbour 01
                                           All other prefixes
                                           remain untouched
```

Creating route-maps – neighbour 2

```
Don't announce these
route-map bgp-neigh-02 deny 10
                                           prefixes to neighbour 02
match ip community 100 120
route-map bgp-neigh-02 permit 20
match ip community 101 121
                                           Single prepend of these
 set as-path prepend 100
                                           prefixes to neighbour 02
route-map bgp-neigh-02 permit 30
match ip community 102 122
 set as-path prepend 100 100
                                           Double prepend of these
                                           prefixes to neighbour 02
route-map bgp-neigh-02 permit 40
match ip community 103 123
 set as-path prepend 100 100 100
                                           Triple prepend of these
route-map bgp-neigh-02 permit 50
                                           prefixes to neighbour 02
                                          All other prefixes
                                           remain untouched
```

Operator BGP configuration

```
router bgp 100
address-family ipv4
neighbor 100.67.3.2 remote-as 200
neighbor 100.67.3.2 route-map bgp-neigh-01 out
neighbor 100.67.3.2 route-map policy-01 in
neighbor 100.67.3.2 activate
neighbor 100.67.3.6 remote-as 300
neighbor 100.67.3.6 route-map bgp-neigh-02 out
neighbor 100.67.3.6 route-map policy-02 in
neighbor 100.67.3.6 activate
```

- The route-maps are then applied to the appropriate neighbour
- As long as the customer sets the appropriate communities, the policy will be applied to their prefixes

Customer BGP configuration

```
router bgp 600
address-family ipv4
neighbor 100.69.1.1 remote-as 100
neighbor 100.69.1.1 route-map upstream out
neighbor 100.69.1.1 prefix-list default in
neighbor 100.69.1.1 activate
!
route-map upstream permit 10
match ip address prefix-list blockA
set community 100:5010 100:5023
route-map upstream permit 20
match ip address prefix-list aggregate
```

□ This will:

- 3x prepend of blockA towards their upstream's 2nd BGP neighbour
- Not announce blockA towards their upstream's 1st BGP neighbour
- Let the aggregate through with no specific policy

Customer Policy Control

- Notice how much flexibility a BGP customer could have with this type of policy implementation
- Advantages:
 - Customer has flexibility
 - Operator Technical Support does not need to be involved
- Disadvantages
 - Customer could upset the operator's loadbalancing tuning
- Advice
 - This kind of policy control is very useful, but should only be considered if appropriate for the circumstances

Conclusion

Communities

- Communities are fun!
- And they are extremely powerful tools
- Think about community policies, e.g. like the additions described here
- Supporting extensive community usage makes customer configuration easy
- Watch out for routing loops!

Using BGP Communities
