## **BGP Tool Hints**

Here are some docs about how to build the various BGP tools out there.

## **Building BGPDUMP**

First off, we clone the git repo locally. Go to the place where you normally do your development work (for example, /usr/local/src), and:

```
git clone https://github.com/RIPE-NCC/bgpdump.git
```

Next make sure we have the libraries and packages we need installed:

```
sudo apt install libz-dev libbz2-dev autoheader
```

and then go into the **bgpdump** folder and build the **Makefile**:

```
cd bgpdump
./bootstrap.sh
```

Once this is done we can then build **bgpdump**:

make

and then install it:

```
sudo make install
```

which will put bgpdump into /usr/local/bin.
