## **BGP Tool Hints**

Here are some docs about how to build the various BGP tools out there.

## **Building BGPDUMP**

BGPDUMP is a tool and set of libraries maintained by the RIPE NCC which reads MRT (Multi-Threaded Routing Toolkit) files and outputs them in human readable format (ie ASCII).

First off, we clone the git repo locally. Go to the place where you normally do your development work (for example, **/usr/local/src**), and:

git clone https://github.com/RIPE-NCC/bgpdump.git

Next make sure we have the libraries and packages we need installed:

sudo apt install libz-dev libbz2-dev autoheader

and then go into the **bgpdump** folder and build the **Makefile**:

cd bgpdump ./bootstrap.sh

Once this is done we can then build **bgpdump**:

make

and then install it:

sudo make install

which will put **bgpdump** into /usr/local/bin.

You can now take your MRT files, eg as produce by RouteViews and convert them into plain text for further analysis.

## **Building a Looking Glass**

These instructions cover how to put together the Cougar Looking Glass code. Why choose this one? Well, it's there, it seems to work fine, and installs nicely on Ubuntu 22.04.
