

# Workshop Development Notes

Needs to cover: \* setting up IS-IS

- NSAP address plan
- setting metrics, level-2, wide metrics
- selecting DIS
- multi-topology
- point-to-point ethernet
- Notes:
  - all done in existing IS-IS Lab

\* securing IS-IS (with OSPF side example)

- neighbour authentication
- no IS-IS outside ASN
- Notes:
  - all done in existing IS-IS Lab
  - need to add OSPF footnote example

\* setting up BGP securely

- RFC8212 - filters in and out on eBGP
- passwords on eBGP and iBGP sessions
- RIR checks on assigned address space of customers - jwhois
- RFC6890 filtering of bogons & Team Cymru bogon BGP feed
- Notes:
  - 8212 needs to be explicitly mentioned in eBGP lab
  - the rest all covered in BGP Best Practices slide deck

\* BGP scalability & stability features

- iBGP between loopbacks & next-hop-self
- route reflector
- deterministic-med
- BGP distance > IGP distance
- stable announcement of covering aggregates out of all eBGP peers
- Notes:
  - All done in existing BGP materials & labs

\* BGP security features

- max-as-limit
- max-prefix
- ttl-security aka GTSM

- community propagated for iBGP by default, eBGP selective
  - strip private ASNs
  - Notes:
    - Needs a new lab “Securing BGP Lab”
- \* Setting up Communities for BGP scaling
- security feature → consistent policies across the ASN
- \* Control plane security
- setting up SSH on routers
  - protecting VTYS with access filters
- \* uRPF
- show how to set up
- \* RTBH
- set up within an AS
  - set up between ASNs
    - need to have done communities for this
- \* BGP SEC
- Creating ROAs (RIR dependent, but explain the process)
  - Installing and operating NLnet Labs Routinator
    - need containers on VTP for this
  - Setting up RPKI support on a router
  - Implementing route origin validation & related policies
    - Need address space that has been validated - APNIC offered their blocks, but longer term we should have our own.
  - propagating validation state across iBGP
    - standards which vendors aren’t supporting, or DIY?
- \* Troubleshooting BGP Security Operations
- RouteViews: for analysis, monitoring, troubleshooting
  - Looking Glasses supporting ROA/ROV
    - SEACOM
    - HE BGP Tool: [bgp.he.net](http://bgp.he.net)
  - RIPE NCC: [bgpplay](http://bgpplay)
- \* MANRS
- conclude with summary of MANRS and what it is about
