Workshop Development Notes

Needs to cover:

- setting up IS-IS
    - NSAP address plan
    - setting metrics, level-2, wide metrics
    - selecting DIS
    - multi-topology
    - point-to-point ethernets
    - Notes:
        - all done in existing IS-IS Lab
- securing IS-IS (with OSPF side example)
    - neighbour authentication
    - no IS-IS outside ASN
    - Notes:
        - all done in existing IS-IS Lab
        - need to add OSPF footnote example
- setting up BGP securely
    - RFC8212 - filters in and out on eBGP
    - passwords on eBGP and iBGP sessions
    - RIR checks on assigned address space of customers - jwhois
    - RFC6890 filtering of bogons & Team Cymru bogon BGP feed
    - Notes:
        - 8212 needs to be explicitly mentioned in eBGP lab
        - the rest all covered in BGP Best Practices slide deck
- BGP scalability & stability features
    - iBGP between loopbacks & next-hop-self
    - route reflector
    - deterministic-med
    - BGP distance > IGP distance
    - stable announcement of covering aggregates out of all eBGP peers
    - Notes:
        - All done in existing BGP materials & labs
- BGP security features
    - maxas-limit
    - max-prefix
    - ttl-security aka GTSM
    - community propagated for iBGP by default, eBGP selective
    - strip private ASNs
    - Notes:
        - Needs a new lab "Securing BGP Lab"
- Setting up Communities for BGP scaling

- ○ security feature → consistent policies across the ASN
- Control plane security
  - ○ setting up SSH on routers
  - ○ protecting VTYs with access filters
- uRPF
  - ○ show how to set up
- RTBH
  - ○ set up within an AS
  - ○ set up between ASNs
    - ■ need to have done communities for this
- BGP SEC
  - ○ Creating ROAs (RIR dependent, but explain the process)
  - ○ Installing and operating NLnet Labs Routinator
    - ■ need containers on VTP for this
  - ○ Setting up RPKI support on a router
  - ○ Implementing route origin validation & related policies
    - ■ Need address space that has been validated - APNIC offered their blocks, but longer term we should have our own.
  - ○ propagating validation state across iBGP
    - ■ standards which vendors aren't supporting, or DIY?
- Troubleshooting BGP Security Operations
  - ○ RouteViews: for analysis, monitoring, troubleshooting
  - ○ Looking Glasses supporting ROA/ROV
    - ■ SEACOM
    - ■ HE BGP Tool: bgp.he.net
  - ○ RIPE NCC: bgpplay
- MANRS
  - ○ conclude with summary of MANRS and what it is about
